HIGHLIGHTS OF HISTORICAL ECONOMIC ACCOUNTS:

MBS HISTORICAL ECONOMIC ACCOUNTS FOR THE PROVINCE OF MANITOBA (1981 – 2004)

824–155 Carlton St.
Winnipeg, Manitoba
R3C 3H8

Highlights

- Real Gross Domestic Product (GDP) in Manitoba expanded by an average annual rate of 2.0% in real terms in the last twenty years.
- Economic growth in the last decade (1995-2004) has been notably stronger compared with the previous one (1985-1994).
- Exports led growth in the last twenty years with 4.2% annualized growth followed by imports at 4.0%.
- In the last five years (2000-2004), the Manitoba economy has been led by strong business investments growth of 3.8%.
- Manitoba's nominal GDP (the actual dollars spent and or earned in the economy) accelerated by an average annual rate of 4.4% since 1985.
- Total labour income in Manitoba increased from $7.1 billion in 1981 to over $20.0 billion in 2004, a 181% increase. The twenty year average annual growth in labour income is estimated at 4.1%.
- Corporation profits in Manitoba have increased by 7.7% on an average annual basis since 1985.
- Personal incomes in Manitoba increased by 4.0% on an average annual basis in the last two decades. In 2004, total personal income is estimated at $32.0 billion, up from $16.7 billion in 1985.
- Personal disposable income has been growing by a relatively stable rate of 3.7% annually since 1985.
- The manufacturing sector is the largest industry group in Manitoba accounting for 12.3% of the total economy in 2004. This sector expanded by an average annual rate 2.7% over the twenty year period.
- GDP in accommodation and food sector increased by 0.7% annually since 1985. With several new hotels built in the last five years the average annual growth has increased to 3.4%.

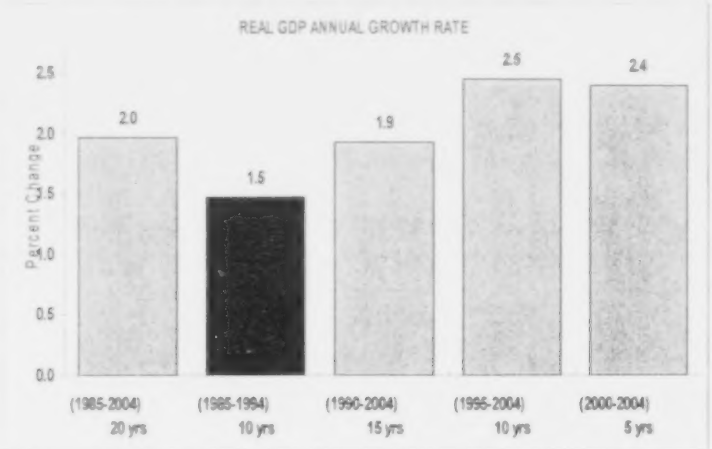
Real Gross Domestic Product at Market Prices

- **The Manitoba economy has expanded by an average annual rate of 2.0% in real terms since 1981.**

- **Provincial Real Gross Domestic Product (GDP) has increased by $12.7 billion from $22.7 billion in 1981 to an estimated $35.4 billion in 2004.** In percent terms, GDP has grown by over 56% in the past twenty-three years. During this period the strongest annual growth was reported in 1984 at 8.2% while the slowest growth was recorded in 1991 at -3.3%.

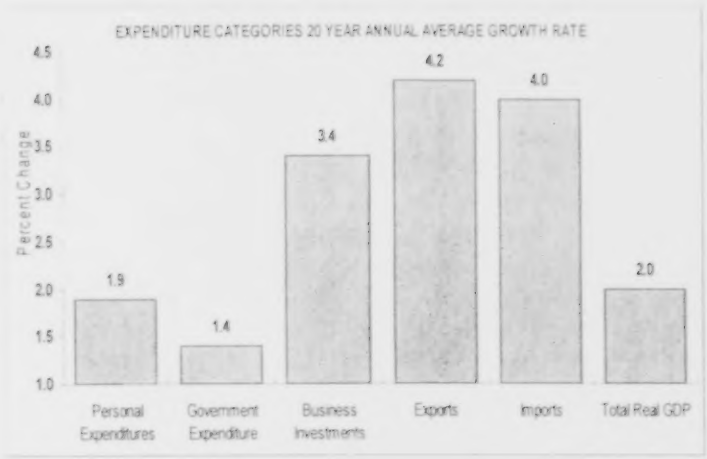
- To examine the historical trends and to compare current performance with past performance the data analysis is separated into five, ten, fifteen and twenty year intervals.

- **Manitoba's economic performance in the last decade (1995-2004) compared with the previous decade (1985-1994) has notably improved.** In the previous decade, which includes a global economic slowdown, the average annual real GDP growth was 1.5%. In the last decade annual average growth is estimated at 2.5% an improvement of 1.0% annually over the previous decade.



- **In the last five years, the economy has performed well above the historical average at 2.4% annual growth and just 0.1% slower than the ten year average annual rate.** According to the MBS Economic Projections, real GDP is forecast to continue to expand at a solid pace in the next five years (2005-2009) averaging 2.4% annual growth.

- Examining the real expenditures categories over a **twenty year period,** the pattern of growth has been relatively broad based, with exports leading growth at 4.2% annualized growth rate followed by imports at 4.0%. In the domestic demand category, business capital investments grew by an annual rate of 3.4%.



- Personal expenditures on goods and services expanded by 1.9% annually over the period from 1985 to 2004, almost matching the real GDP's performance. Government expenditures increased by 1.4% annually in the last two decades.

- **In the last five years, the overall economy grew by 2.4% annually, but this growth was not even throughout all sectors**. The key engine for economic growth was business investment, expanding at an annual rate of 3.8%. The factor behind the surge in capital investments is a booming residential construction sector. The five year average annual growth in residential construction investments is estimated at 9.3%. The deflation in machinery and equipment prices, including vehicles, also contributes to an increase in spending on capital equipment over the last five years. Completion of major construction projects led to an annual average decrease of 1.8% in non-residential construction investments.

- Despite the relative weakness in exports since 2000, imports increased by 2.8% annually. Imports have been partially driven by an increase in domestic demand (consumer, business and government spending) and by the appreciation of the Canadian currency, which lowers the cost of foreign purchases.

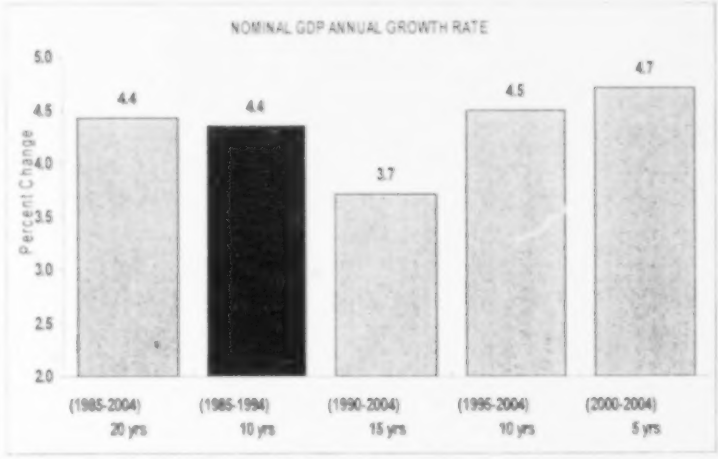
- In the last five years, personal expenditure increased by 2.5% annually while government spending on goods and services grew by 2.2% annually. Manitoba has also experienced a strong increase in population growth in the last five years adding to domestic demand.

Nominal Gross Domestic Product at Market Prices

- **Manitoba's nominal GDP (the actual dollars spent and or earned in the economy) accelerated by an average annual rate of 4.9% since 1981.**

- The nominal economy has more than doubled in the last twenty-three years from $13.6 billion in 1981 to $40.2 billion in 2004, an increase of $26.6 billion. With the exception of 1991, the provincial nominal GDP has increase in all years since 1981. In 1991 nominal GDP contracted by 0.7%. The highest annual growth was recorded in 1984 at 12.5%.

- Analyzing the data for the past two decades, the nominal GDP series for Manitoba has progressively improved through time.

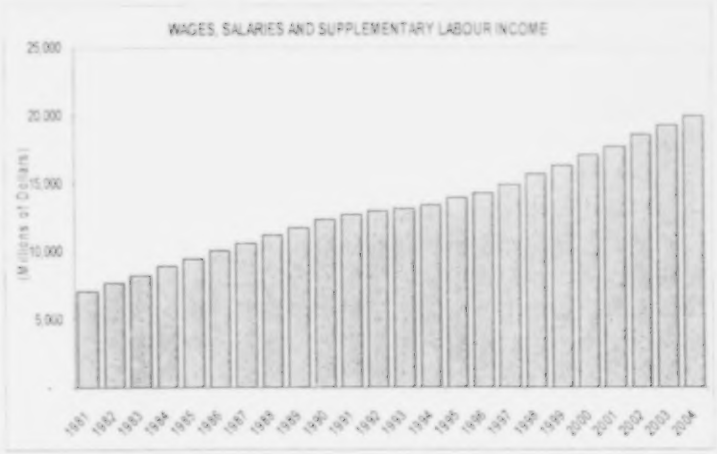


- The income earned by persons, business and governments or spent annually in the province has increased by 4.4% in the last twenty years. Over fifteen years (1990-2004) period, which includes an economic slowdown, the average annual rate is slightly lower at 3.7%.

- Nominal GDP accelerated by 4.5% annually in the last ten years, partially driven by a sharp increase in corporate profits. In the last five years, both corporate profits and labour income are the main contributors to the 4.7% annual growth in nominal GDP, which is well above the historical average rate of 4.4%.

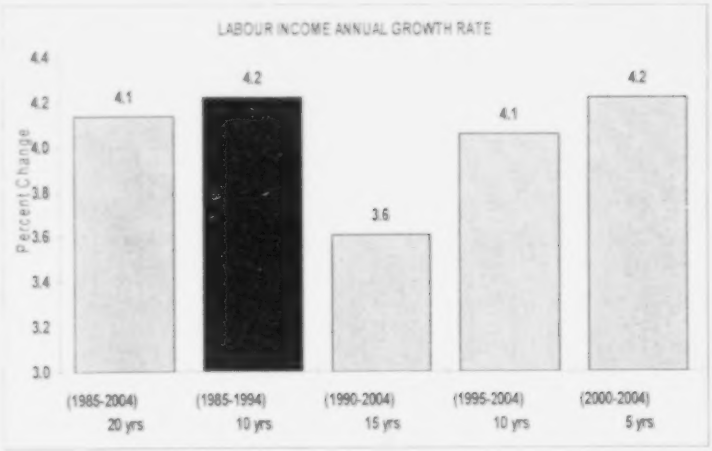
- Labour income has shown a strong, steady and consistent growth pattern over the twenty year historical time period. **Total labour income in Manitoba**

- **increased from $7.1 billion in 1981 to over $20.0 billion in 2004**, a 181% increase.



- **Labour incomes accounts for about 50% of all incomes generated in the province.** This share has fallen slightly since the early 1980's when labour income accounted for approximately 53% of all income.

- **The average annual growth in labour income over the past twenty years is 4.1%.** This growth rate has remained relatively constant throughout the twenty, ten and five year periods considered in this study. The exception is the 3.6% annual growth in the fifteen year time frame from 1990 to 2004. During this period labour income growth was slowing as wages and salaries increases were modest compared with the large inflation induced increases in the 1980's. Employment growth was also slowing as the global economic slowdown reduced production.



- In the last five years, labour income increased by 4.2% annually. During this period, employment increased by 1.3% annually. Due to recent increases in wages and salaries, there is a slight pick up in the growth rate of labour income between the ten year (4.1%) and the five year (4.2%) average.

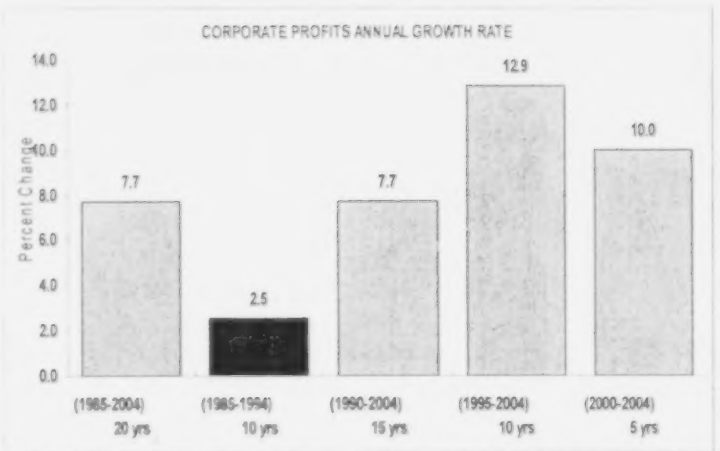
- The historical pattern for corporate profits is distinctively different when compared with labour income.

- Profits have exhibited a classical business cycle pattern showing an expansion phase followed by a contraction phase. The expansion phase occurred between 1983 to 1989, 1994 to 2000 and 2002 to 2004. The contraction phase in-between 1989 to 1992 was relatively prolonged compared to the other periods that lasted only a single year.

- Since 2001, nominal profits in Manitoba have grown at an exceptional rate, generating a three year average annual growth rate of 13.8%.

- **Corporation profits in Manitoba have increased by 7.7% on an average annual basis in the last two decades.**

- Turning around and starting expansionary growth in 1994, corporation profits have been growing at an extremely strong pace.

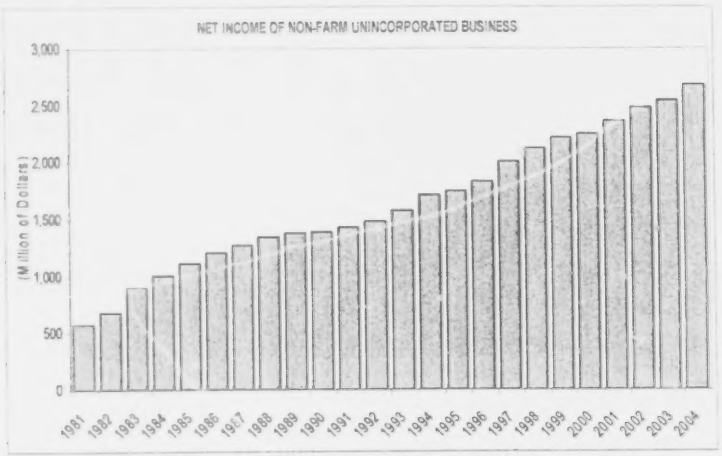


- **The ten year average annual growth in profits is reported at 12.9% followed by the five year average rate of 10.0% annually.** Due to the weakness in corporate earning in the early 1990's, the average annual growth was 2.5% annually in the ten year period from 1985-1994.

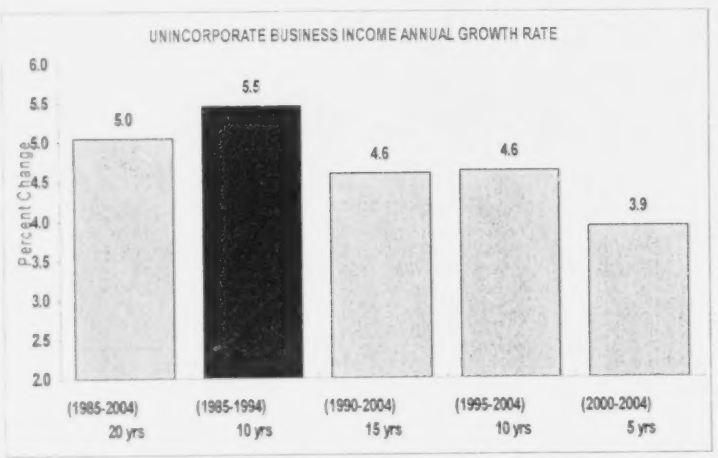
- **Corporation profits contribute 9.0% of all incomes generated in the province (2000-2004 average). Over the last two decade this share has increased marginally from 7.5% estimated in the early 1980's (1981-1985 average).**

- Contributing about 6.7% of all incomes generated in Manitoba, net non-farm incorporated business income consists of self-employed earnings of working proprietors and professional practitioners. Net rental income either paid or imputed is also included in this category.

- **Net income of unincorporated businesses** has grown at a relatively solid pace in the last twenty years, increasing from $1.0 billion in 1984 to $2.7 billion in 2004. The twenty year average annual rate is 5.0%.

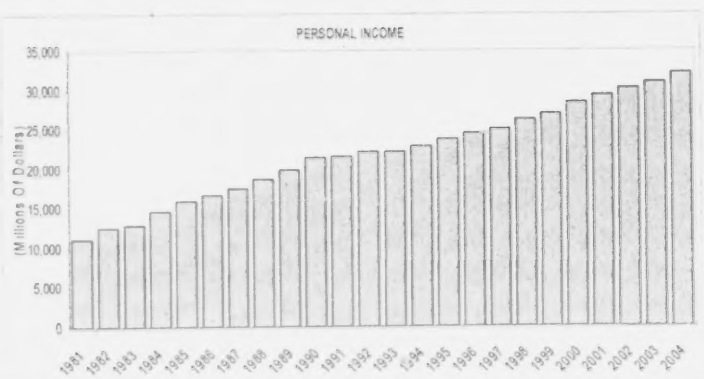


- In the last ten years annual growth in unincorporated income is estimated at 4.6%, slowing slightly to 3.9% annual growth in the last five years. The slower growth in the last five-year period is partly due to the modest growth in imputed rent. The historical low interest rates have lowered mortgage costs on owner occupied homes, thereby, softening increases in imputed rent.



Personal Incomes

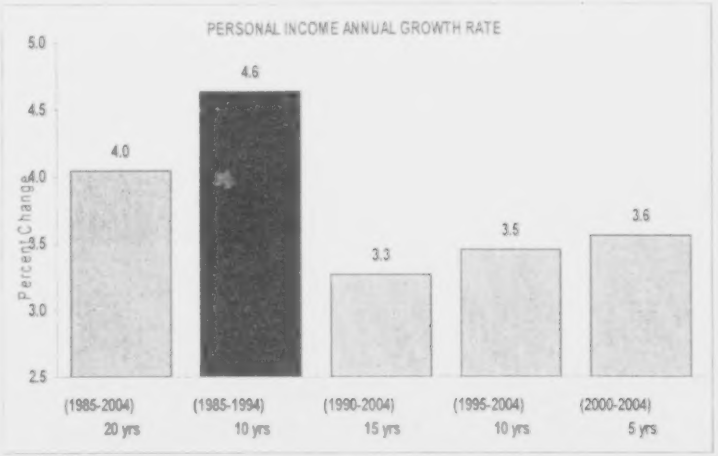
- **Personal incomes in Manitoba have been growing at a nominal annual rate of about 4.0% in the last twenty years.** In 2004, total personal income is estimated at $32.0 billion, up from $11.2 billion in 1981.



- In the economic accounts there are five major categories of personal income: labour income, unincorporated income, farm income, interest & dividend income and transfer to persons (from government, businesses and non-residents).

- The largest component of individual incomes is labour income (63%), followed by transfers from governments (17%), interest income (11%), unincorporated business income (8%) and farm income (1%).

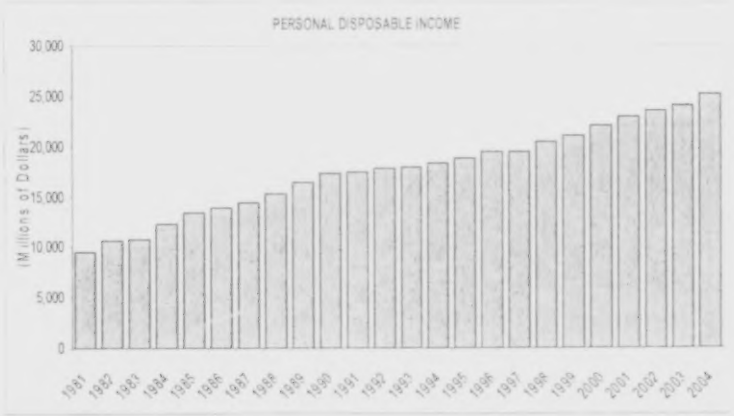
- Personal income growth was strongest during the decade beginning in 1986. Interest rates were historically very high during this period boosting interest earnings on personal investments. Labour income growth was starting to slow from very high annual growth rates.



- Partly due to lower earnings from interest bearing assets and slower growth in government transfers to individuals, personal incomes in the last decade expanded by 3.5% annually.

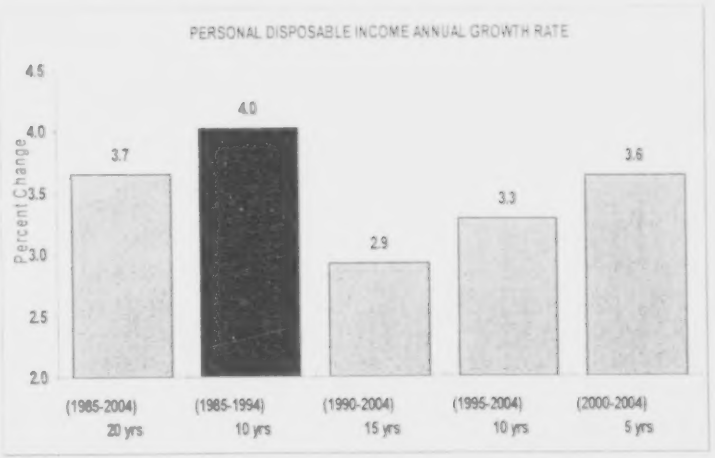
- In the last five years, personal income growth has improved to 3.6% annual average growth as both labour income and government transfers to persons increased. Within government transfers the main contributing factors were old age security payments (OAS) and Canada Pension Plan (CPP) payments to persons.

- **Personal disposable income has been growing by a relatively stable rate of 3.7% annually since 1985**. In 2004, total personal disposable income in Manitoba is estimated at $25.2 billion.

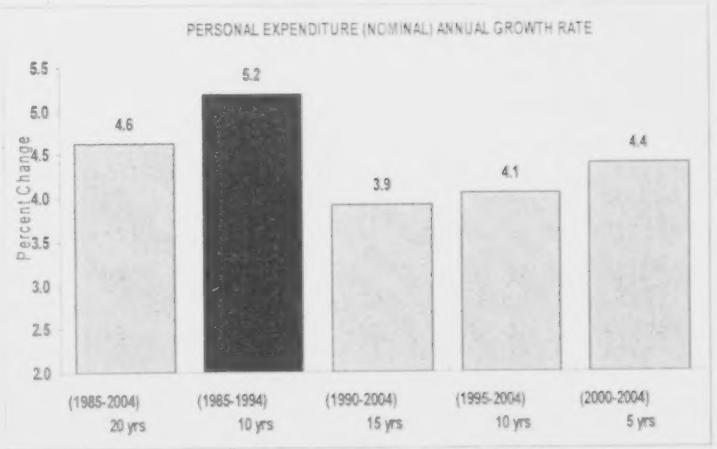


- Due to slower employment growth in the early 1990's the fifteen-year average rate

of growth, from 1990 to 2004, was reduced to 2.9%. In the last five years, annual growth in disposable income is estimated at 3.6% matching the historical average. Personal disposable income is equal to personal income net of income taxes, unemployment insurance, pension deductions and other government payments from persons.

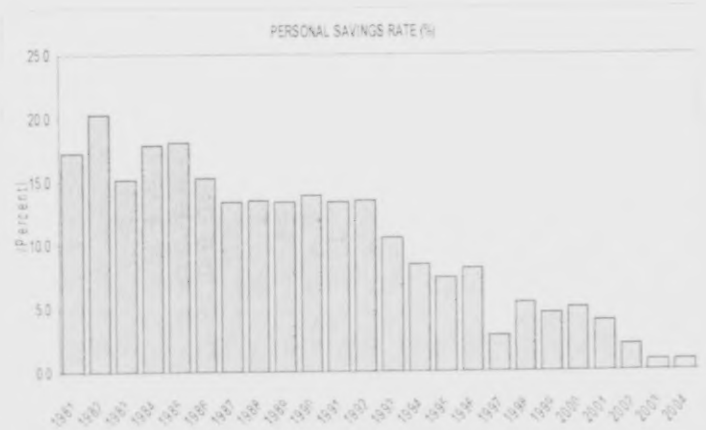


- Personal expenditure on good and services has expanded by an annual average rate of 4.6% since 1985.



- In the early 1980's, consumer spending was growing at a rapid pace in Manitoba. For four consecutive years, starting in 1982, personal spending on goods and service grew by over 8% annually. The highest annual rate was recorded in 1984 at 10.5%. Since then spending has remained firm despite the 1990's recession. In the last 10 years personal spending has averaged 4.1% annually increasing to 4.4% annually in the last 5 years.

- **With personal disposable income expanding by an average annual rate of 3.7% in the last 20 years and personal spending growing by an average of 4.6%, individual savings have fallen sharply in Manitoba**.



- Comparing the last two decades, the level of savings has fallen dramatically. Between 1985 and 1994, average annual personal savings were calculated at around $2.1 billion. In the last 10 years the average annual savings have dropped substantially to $855 million. This is a 60% decline from the previous decade.

- In the last five years, as growth in personal consumption continues to outpace disposable income the depletion of personal savings continued. The level of savings has averaged $583 million a year in the last 5 years.

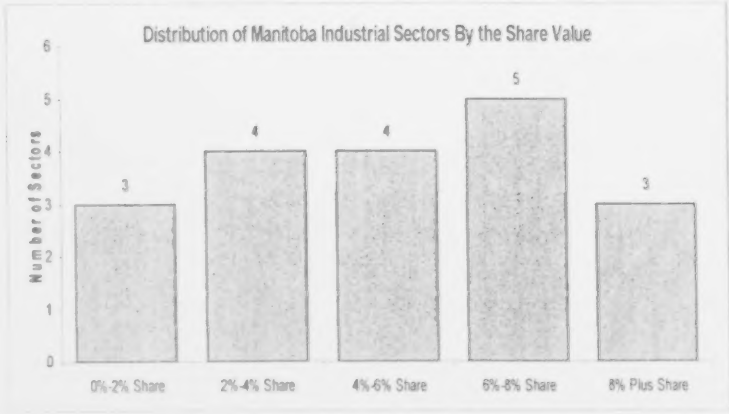
- *It should be noted that in the personal income statistics, income generated from RRSP withdrawals or from the sale of an asset (cottage, house etc…) is not considered as disposable income. Consequently, personal savings can turn negative if more and more spending is generated from these types of income sources. In other words, the personal spending amount is greater than the net amount earned from traditional income sources. As the demographic profile indicates an aging population, the amount of RRSP withdrawals and selling off of life-long assets (wealth erosion) will continue to accelerate, generating a negative savings rate in the future. However, if new spending is not the result of spending retirement savings, but is coming directly from a huge buildup of unsustainable credit, future spending may be severely curtailed.*

Real Output By Industry at Basic Prices

- For the industrial Accounts, **MBS combines personal, business and government value added economic activity into industries according to the similarity in the production process.** Producing units are grouped into industries by the types of raw materials, skills, and technology used. What is important in the delineation process is the method of production, and not the product (good and or service). Due to this aggregation method, it is not possible to generate separate accounts for the goods and services components of a sector. For example, the mining industry will include services incidental to mining, which are accommodation and meals services at mining camps. It should be noted that the mining sector only includes activities related to the extraction of naturally occurring minerals (solid, liquid or gas). It does include the processing of these minerals. The processing is included in the manufacturing sector.

- This methodology used by MBS follows the North American Industrial Classification System (NAICS). In this publication, the economy is divided into 19 sectors.

- DIVERSE NATURE OF THE MANITOBA ECONAOMY



- **No one sector dominates the Manitoba economy.** Manitoba has almost an equal number of sectors in the size categories: small, medium and large sectors.

- **Examining the share sizes of all 19 sectors considered in this study:** there are 3 industries that account for less than 2% each of the economy, 4 sectors that account for 2% to 4% each of the economy and 4 sectors that account for 4% to 6% each. There are 5 sectors that each account for 6% to 8% and 3 sectors that each contributes above 8% share of the Manitoba economy.

- One of the advantages of a diverse economy is that any major shifts in output of one sector would have a small impact on the total economy. An economy dominated by a single sector would potentially experience more fluctuations in GDP.

- The manufacturing sector is the largest industry group in Manitoba. In 2004, this sector accounted for 12.3% of the total economy. In the past two decades, the manufacturing

Manitoba Industrial Sector Shares

(Five-Year Average % Share: Ascending Order)

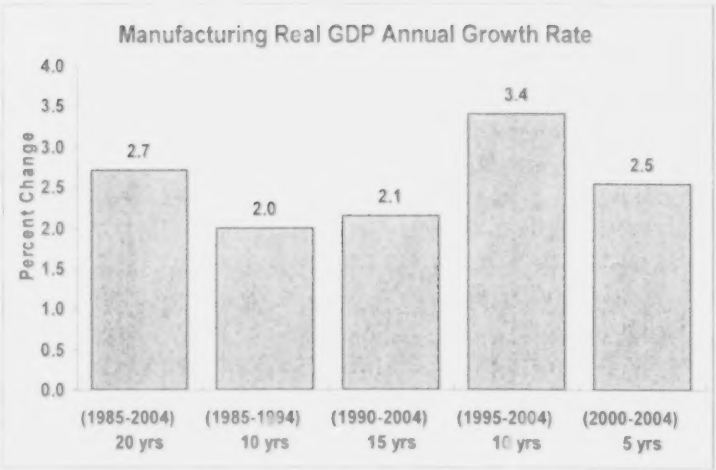
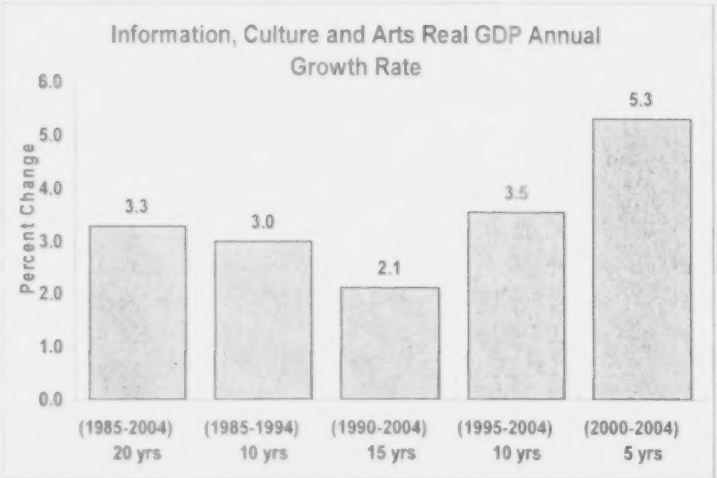
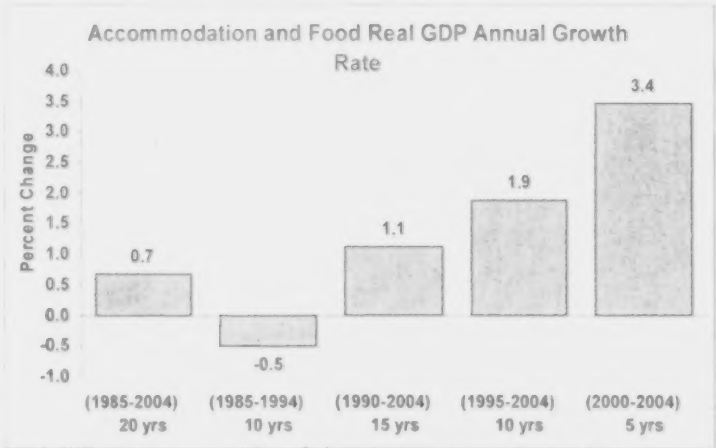
Imputed Rent	9.0
Finance, Insurance, Real Estate, Rental & Leasing	10.9
Manufacturing	12.5

sector has always been the largest contributor to the local economy. The pace of growth in this sector has also been above the provincial average at 2.7% annual growth since 1985. This sector experienced exceptional growth after the 1990's recession when exports to the US flourished. As a result the ten year annual growth is calculated at 3.4%. During the last 5 years, the demand for Manitoba's export market in both Canada and the US has slowed, which has resulted in a slow down in manufacturing activity in the province.





- As new information technology products are introduced and gain acceptance the output of the information, culture, arts and recreational sector is expanding rapidly. The average annual output for this sector has increased by 1.7% from a ten year average annual growth of 3.5% to a five year average of 5.3%.



- The construction of new hotels throughout Manitoba in the recent past has added significant accommodation, conferences and meal service capacity in the provinces. As a result, the average annual growth in value added GDP in accommodation and food sector has increase to 3.4% in the last five years, up from the 1.1% calculated for the ten year average.

User Notes:

The MBS Historical Economic Accounts document is a special report generated to provide detailed information on how the Manitoba economy has performed over the past two decades.

MBS maintains the historical series for all the key economic expenditures in Manitoba made by businesses, governments and households. MBS also tracks all the incomes earned within the economy by the above mentioned stakeholders. For industrial production, MBS maintains a detailed series on GDP production of all the major industry groups in Manitoba.

For further information on the data or to purchase the Economic Accounts data series, please contact Earl Turnbull at (204) 945-2995
